

Test Cases

Dynamic metadata driven react form

TEST CASE #1

```
validations:
[
  {
    type: "required",
    params: ["Name is required"],
  },
],
```

Results in required field

If empty, error will be thrown with the error message.

TEST CASE #2

```
useEffect(() => {
  getFormData();
}, []);

const getFormData = () => {
  axios.get(getUrl).then((response) => {
    setForm(response.data);
    console.log("Data", form);
  });
};
```

Removing this code segment will result in fetching the static formData from utils/formData.js

TEST CASE #3

```
axios.post(postUrl, val)

  .then(function (response) {

    console.log(response);

  })
```

Removing this code segment will result just in logging the data entered in the form field.

TEST CASE #4

On changing the JSON object containing the metadata of form in
`tech-weirdo/server/utils/formData.js`,

Will send the newly modified form to the frontend to render dynamically.
